Setup - step by step

- 1. Configure Samba and Kerberos using smb.conf and krb5.conf
- 2. Set up resolv.conf to use Active Directory as the machines DNS server
- 3. It should now be possible to join the AD domain with (replace Administrator with your user): net ads join -U Administrator
- 4. Start winbind with 'winbindd' or use the machines service handler.
 5. If should now be possible to verify the connection with: 'wbinfo-p'
- 6. And to authorise a user: 'ntlm_auth --username <your user> --domain <your domain>'
